They yield the second year, and require protection during Winter by earthing up and mulching. In the Northern States it is better to treat this plant as an annual, sowing seeds under glass early in February and keeping the seedlings growing vigorously until May, when they should be set out in rich soil, when they will produce fine heads the first season.

Argenteuil Asparagus.

ASPARAGUS. *Esparrago*, (Sp.)

Culture. Sow the seeds thinly in drills one foot apart and one inch deep. The permanent bed should be trenched very deeply, and well manured with rich, thoroughly decayed manure. Wide drills should then be made, 3 feet apart, and deep enough to admit of the top of the plants being covered 6 inches. Set the plants, one or two years old, 12 inches apart in the rows, carefully spreading out and separating the roots. For the sake of convenience one drill should be made at a time, and the planting and covering completed before another is commenced. In November the plants should have their annual top dressing of manure after the stalks have been cleared away. The dressing should be forked in as soon as the ground can be worked in Spring, and the bed neatly raked. *One ounce of seed sows 60 feet of drill; 5 pounds sow one acre.*

Sow the seeds in March or April in a hot-bed or cold frame. As soon as the plants are 3 inches high, transplant into a prepared border, setting them 4 inches apart. When grown 6 inches, and fine stocky plants, set in richly manured, deep soil, in rows 3 feet apart, and about 9 inches from plant to plant. Water, if dry weather follows transplanting. During the next two months all the attention required is to keep down weeds. Afterwards earth up a little, and continue doing so at intervals until only the tops of the leaves are visible late in Autumn. Never hoe or earth up when the plants are wet. To keep celery in Winter they may be re-planted into a cool cellar, allowing fully 3 inches of soil on the floor. Stand the plants in rows not more than 9 inches apart and partition off with boards equal to the height of the plants. They will be ready for use in January. 1 ounce of seed produces about 4,000 plants.

▲ Bed of Farquhar's English Milltrack Mushroom Spawn.

MUSHROOM. (*Agaricus Campestris.*)

CULTURE.

Mushrooms are more easily cultivated than many people imagine, and may be grown in any room or cellar where the temperature can be maintained at from fifty to sixty-five degrees. For the bed, use fresh stable manure, which should consist of half droppings and half short litter; this must be thoroughly turned and mixed; many growers prefer a mixture of three parts horse droppings and one part good fresh loam. Before being placed in the bed, let the manure be put in some dry place to sweeten, mixing it thoroughly and turning it three or four times, when, if preferred, the loam may be added. Upon a dry, firm bottom or shelf, proceed to make the bed by spreading a thin layer of the prepared mixture, pounding it firm, and continue thus till the bed is 12 inches thick. Leave it thus for about a week, or until the temperature has subsided to eighty-five degrees. Then make holes about 10 inches apart, and put in each a piece of spawn about the size of an egg. Press the spawn firmly into the compost about 2 inches, leaving the top uncovered to allow the excess of heat and moisture to pass off without injury to the germs. After ten days fill the holes and cover the whole bed with 2 inches of fresh loam, and over this place a few inches of straw. If the temperature is right, mushrooms will appear in six to eight weeks from time of spawning. The bed will continue bearing from four to six weeks. If the surface of the bed becomes dry at any time, it should be moistened freely with water at a temperature of eighty to eighty-five degrees. To stimulate the bed when it seems exhausted, the following treatment will sometimes give wonderful results: Soak the whole bed thoroughly with water at a temperature of one hundred and ten degrees, adding one pound of sheep manure to every five gallons. *One pound of Farquhar's English Milltrack Mushroom Spawn is sufficient for six square feet of bed.*

Farquhar's Selected
Yellow Globe Danvers
Onion.

Culture. The Onion had been cultivated as an article of food from the earliest times, and is perhaps at the present day more universally grown than any other vegetable. A good crop is impossible unless the soil is very rich and kept clean. Use well-rotted manure freely, and get the crop in as early as possible in Spring, even should the weather be cold and unpleasant. Sow in drills one foot apart and cover about one-third of an inch, treading or rolling after sowing so that the hot, dry atmosphere may not destroy the sprouting seed. When three inches high, thin to two inches apart. Stir the ground freely without disturbing the young plants and keep free from weeds. *One ounce of seed to 100 feet of drill; 4 to 5 pounds an acre.*

Farquhar's Selected Yellow Globe Danvers.

POTATOES.

A good, sandy loam produces the best potatoes, but they can be grown on all kinds of soil. New or pasture land, with the turf freshly turned, produces the finest crop. Make furrows of good depth, 3 feet apart. Scatter a liberal dressing of phosphate or decayed stable manure along the drill, and set the seed about 10 inches apart in the rows. Cover with about 2 inches of soil, and begin to cultivate when the plants are well up. At each successive hoeing, bring additional soil about the plants. A change of seed is the best antidote for disease. *Four barrels are sufficient to plant one acre in drills.*

On account of unsettled market conditions this season, we are unable to quote prices of Potatoes at the time of printing this catalogue. Prevailing prices will be quoted on application.

FARQUHAR'S EVERGREEN LAWN GRASS.

Farquhar's Evergreen Lawn Grass is a mixture of the finest American and European grasses adapted to lawn-making. The formula for this mixture is the result of life-time practical experience in making and maintaining lawns. Neither pains nor expense are spared in obtaining grasses of high vitality and purity. It is our constant aim to make Farquhar's Evergreen Lawn Grass the best, purest and most permanent Lawn Grass sold. For the formation of new lawns sow not less than 5 to 6 bushels per acre. One quart will sow a plot 15 x 20 feet or 300 square feet. For renovating existing turf, use one-half of this quantity. **Price per quart, 35 cents** (by mail, 40 cents); 4 quarts, \$1.25; peck, \$2.00; bushel of 20 lbs., \$7.50; 10 bushels, \$72.00.

Farquhar's "Heavy-Seed" Evergreen Lawn Grass Mixture.

Many lawns and golf-link experts now prefer to use grass seed mixture composed chiefly of hulled seeds. To meet this demand, we now offer this mixture, the formula of which differs but slightly from that of "Farquhar's Evergreen." In our "Heavy-Seed Evergreen Mixture" most of the grasses have been divested of their chaff or hulls—the exceptions being several valuable kinds to which the hulling process cannot be practically applied. For sowing new lawns, use four to six bushels per acre and for renovating old lawns, use two to three bushels per acre. Price per bushel, \$10.00; 10 to 25 bushels, \$9.75 per bushel; 25 to 50 bushels, \$9.50 per bushel; 50 bushels and upwards, \$9.00 per bushel.

R. & J. Farquhar Co., Boston, Mass.

Wald Garden, Brookline.

Gentlemen:—It gives me great pleasure to inform you of the good results I have had with your Lawn Grass Seeds.

I have used them extensively, not only in Massachusetts, but in Washington, D.C., and in St. Louis, Mo., at both of which places there is difficulty in getting good Lawns, and where the successful results from your seeds have been remarkable.

The Wald Garden in Brookline, which has been so frequently described and illustrated in the leading periodicals of the country, affords the very best evidence of the high quality, purity and permanence of your Lawn Grasses.

Your Mixtures for various situations and for different parts of the country, I consider especially valuable.

Yours truly, Duncan Finlayson.

FARQUHAR'S BOSTON PARKS LAWN SEED.

This formula has been used for many years in the Boston Park Department and in the Metropolitan Parks of Massachusetts. It is unquestionably one of the best mixtures for park or where a free growing, hard-wearing turf is desired. Sow not less than 80 lbs. per acre and in many cases 100 lbs. will be an advantage. **Price, 60 cents per lb.; by mail, 65 cents.** 10 lbs., \$5.00; 100 lbs., \$45.00. 25 lbs. and upwards at the 100-lb. rate.

FARQUHAR'S SPECIAL GRASS SEED MIXTURES.

FARQUHAR'S FAIR GREENS MIXTURE.

This is composed mainly of perennial native Grasses and two very important European Grasses which have proven of great value for Fair-Green use. They are all of dwarf, spreading growth, forming a close velvety surface which improves from year to year if given proper care. It contains no clover, which is objectionable on account of making the surface slippery. If white clover is desired, the quantity sown should not exceed one-half pound per bushel of grass seed. Sow 100 to 150 lbs. per acre. Per lb., 50 cts.; per 100 lbs., at 48 cts. per lb.; per 1000 lbs., at 45 cts. per lb.

Messrs. R. & J. Farquhar & Co., Boston, Mass.

Gentlemen:—I have used your Lawn Grasses for the past eight years and have found them of extra fine quality and entirely free from foul seeds. Your Putting-Green Mixture is the finest I have ever seen—the greens at Bretton Woods produced from it are unrivalled.

Yours truly,

Bretton Woods Golf Club, Bretton Woods, N. H.

G. S. MERRITT, Prof. Golfer.

FARQUHAR'S GRASSES FOR PERMANENT HAY CROPS AND PASTURES.

PRICES SUBJECT TO MARKET FLUCTUATION.

These contain only the most suitable Grasses, the proportionate quantity of each being regulated by soil, situation and purpose for which desired. The object to be attained is a constant, successive growth of rich pasturage from Spring until Fall. It is a well-established fact that soil sown with a variety of different grasses which are adapted to the soil, and which attain perfection at alternate months from April to September, *produce very much larger and more satisfactory crops, both for hay and pasturage*, than when only one or two kinds of grasses or clovers are sown. The good results obtained from our Special Grass Seed mixtures are demonstrated by the constantly increasing demand for them. Fall seeding is preferable, but Spring sowing will be successful if done early, while the land is cool and moist. In addition to the Grasses, we advise sowing 10 lbs. of Mixed Clover Seed per acre. Clover seed should be sown separately as it is heavier than Grass seeds and settles at the bottom when mixed with them, and in consequence is likely to be sown unevenly. Clovers in their young state are tender in our climate, and should therefore be sown in Spring.

Pastures sown with these Permanent Mixtures should last indefinitely if given a frequent topdressing of manure or fertilizer, maintaining their cropping qualities throughout the entire season.

CLOVERS.

Prices subject to market fluctuations.

ALFALFA or LUCERNE. (*Medicago sativa.*) The chief merit of Alfalfa is the fact that it can be cut three or four times in a season. The soil should be deep, rich and well prepared. It does not succeed on compact clay, nor on land with impervious subsoil. The roots shoot downwards, reaching ten to fifteen feet below the surface and will therefore resist the driest weather. Sow 15 to 20 lbs. per acre. Lb., 45 cts.; 10 lbs., \$4.00; 100 lbs., \$38.00.

ALSIKE or SWEDISH. (*Trifolium hybridum.*) This Clover will thrive where the soil is quite wet, and will even stand flooding without being killed. Productive and sweet and extremely valuable for both pasturage or soiling. Lb., 45 cts.; 10 lbs., \$4.25; 100 lbs., \$40.00.

MAMMOTH or LARGE RED NORTHERN. (*Trifolium pratense.*) On rich, loamy soils this variety grows nearly twice as large as the Medium Red Clover and is earlier in starting growth. Lb., 50 cts.; 10 lbs., \$4.75; 100 lbs., \$45.00

RED MEDIUM. (*Trifolium pratense.*) The best Clover for all practical purposes. Succeeds best on rich, warm loams, containing humus. Lime and potash are essential for its best development. A biennial, but by close pasturage may be made to last several years. Lb., 50 cts.; 10 lbs., \$4.75; 100 lbs., \$45.00.

SCARLET or CRIMSON CLOVER. (*Trifolium incarnatum.*) This annual Clover thrives best on warm, loose, sandy soil. Its chief value is as a Winter or early Spring pasture crop and as a green manure. A rapid growing, nitrogen-storing plant, and as such is invaluable for growth in orchards and wherever it can occupy the land from July to December. Sow twenty pounds per acre. It may be sown at any time from May to October. Lb., 35 cts.; 10 lbs., \$3.35; 100 lbs., \$32.00.

Mammoth Red Clover.

Hungarian Millet.

WHITE CLOVER.

(*Trifolium repens.*)

This clover should al-

ways be sown on permanent or temporary pastures. Will grow on any soil, but especially adapted to low meadows, where the surface soil is mellow and rich. Sweet and nutritious. Lb., 90 cts.; 10 lbs., \$8.50.

SWEET CLOVER (Bokhara or White Blossom.) (*Melilotus alba.*) A vigorous biennial grown for hay, green forage or pasturage; valuable for soiling. Sow twenty pounds per acre. Lb., 25 cts.; 100 lbs., \$20.00.

MILLETS.

Nothing on the market is as well adapted to cover up shortages in hay crops as are the Millets, yielding quick pasturage on almost any soil. They are rank feeders, however, and do best on a fertile, mellow soil, which has had a liberal application of barnyard manure. Sow in June or July, broadcast, 1 to 1½ bushels of seed per acre, or drill one-half bushel. Cut (if for hay) as soon as the heads are formed.

MILLET, HUNGARIAN. (*Panicum Hungariensis.*) An annual forage plant which germinates readily and withstands drought. If cut early, makes an excellent hay, often yielding two or three tons per acre. Sow from June to August, using about 1½ bushels to the acre. Bushel, (48 lbs.), \$5.00.

MILLET, COMMON. (*Panicum Miliaceum.*) Excellent for forage. Requires a dry, light rich soil. Height, 2½ to 4 ft. Bushel, (50 lbs.), \$5.00.

MILLET, GOLDEN. (*Panicum Germanicum.*) An improved variety, growing from three to five feet high. Under some circumstances it will yield more per acre than the preceding. Bushel, (50 lbs.), \$5.00.

MILLET, JAPANESE. (*Panicum Crus Gali.*) This variety is particularly adapted to the Northern States, making a quick growth and forming one of the best crops for fodder or ensilage. It frequently attains a height of six to eight feet, with numerous side shoots and yielding from ten to fifteen tons of green fodder per acre. If required for dried fodder, it should be cut as soon as the heads have formed; it is relished by stock, and cows fed on it invariably increase in milk. If sown broadcast it requires from 15 to 20 pounds per acre, or in drills 10 to 15 pounds to the acre. Bush. (35 lbs.). Lb., 15 cts.; 10 lbs., \$1.35; 100 lbs. \$12.00.

- Barley, Two Rowed.** Bushel (48 lbs.), \$2.75; 10 bush., \$25.00.
Barley, Beardless. Bushel (48 lbs.), \$2.75; 10 bush., \$25.00.
Bean, Early Green Soja. The best variety for planting in the Northern States, ripening early and producing enormous crops, yielding sometimes as high as fifteen tons of green fodder per acre. It is also a valuable plant for ensilage, and is frequently used in combination with the Japanese Millet in the ratio of two parts Millet to one part Beans. The Soja Bean is also an excellent crop for green manuring, adding a large quantity of humus to the soil. Sow 3 pecks to the acre. Peck, \$2.00; bush. (60 lbs.), \$7.00; 10 bush., \$67.50.
Broom Corn, Evergreen. This variety produces long, straight brush, very fine and always remains green. The best sort for brooms. Height, 7 ft. Sow 10 pounds per acre. Lb., 10 cts.; 100 lbs., \$8.50.
Buckwheat, Common. Should be sown about the middle of June, broadcast, using 1 bushel of seed to the acre. Bushel (48 lbs.), \$3.00; 10 bush., \$28.00.
Buckwheat, Japanese. Excels all other varieties in yield and earliness. On account of its earliness it can be grown farther north than any other. The grains are nearly double the size of those of any other variety. Enormously productive. Bushel (48 lbs.), \$3.00; 10 bush., \$28.00.
Carrot, Field. See page 46.
Corn, Field. See page 45.
Kaffir Corn, White. An excellent fodder plant, either green or dried. The grain is valuable for feeding poultry. Sow 10 pounds per acre. Lb., 10 cts.; 100 lbs., \$8.50.
Pop Corn, White Rice. Fine smooth white grains. Quart, 35 cts.; peck, \$2.50.
Cow Peas. See Peas Field.
Mangel Wurzel. See page 46.

Sudan Grass. A new annual forage-plant of the Sorghum family, valuable for hay or the silo. It is of strong growth and frequently attains a height of 4 to 5 feet, thriving best in hot weather. Two cuttings can be obtained in a season under favorable conditions. The seeds should be sown early in May when the soil has become warm, using from 16 to 24 lbs. per acre. Lb., 15 cts.; 100 lbs., \$12.00.

OATS.

Too little attention is given to the benefits to be derived from a change of seed, which should be made in this country every two or three years, as any one acquainted with our markets can see the degeneracy which takes place from the want of this attention. A judicious selection and change can easily be obtained at moderate prices.

Oats, Welcome. This is now a well-known and extensively grown variety, and is one of the heaviest, handsomest and most productive white varieties grown. They stool heavily with extra strong, straight straw, standing well. Succeeds well in a wide range of climate, and under a great variety of soils and methods of culture. Bushel (32 lbs.), \$1.50; 10 bush., \$13.50; 20 bush., \$25.00.

Oats, White Montana. A very prolific and early variety, yielding enormous crops of fine, heavy grain. The straw is long and strong and is considered one of the most nutritious for green fodder. Bushel (32 lbs.), \$2.00; 10 bush., \$18.50

Japanese Millet.

Peas, Field for Fodder and Green Manuring. The White Canada Field Pea is the best variety for general cultivation; it affords a most profitable crop for fattening stock. It has been grown by dairymen with very satisfactory results, following Winter Rye, which was cut green in June for dairy cows, then stubble turned under and sown with mixed Peas and Oats, thus furnishing a large amount of forage in August, when grass pastures are usually short. Sow 3 bushels to the acre; if with Oats 2 bushels.

Canada, White. Valuable for Northern climates. Peck, \$1.50; bush. (60 lbs.), \$5.00; 10 bush., \$48.00.

Cow Peas, Whip-Poor-Will. (*For fodder or soiling.*) A valuable and nutritious green forage or hay crop. Enriches poor land; improves good land. One of the best and cheapest ways of improving soil is the plowing under of leguminous crops. Cow Peas have been found superior for this purpose, especially on medium or light soils. Like Clover, they absorb nitrogen from the atmosphere, the roots reach deep into the soil and bring up the necessary potash, thus making a complete and natural fertilizer. For fertilizing purposes, Cow Peas are superior to Clover from the fact that the foliage is greater, besides making full growth in from 3 to 4 months. Sow as early as May 10 or as late as July; one (1) bushel to the acre in drills; 2½ bushels to the acre broadcast. Peck, \$1.50; bush., (60 lbs.), \$5.00; 10 bush., \$48.00.

Japanese Buckwheat.

FARQUHAR'S FARM AND FIELD SEEDS.—Continued.

(Prices Subject to Market Fluctuations.)

Rape, Dwarf Essex. A forage plant of great merit, easily grown in any part of the United States, and of great value for sheep and lambs. One acre of Rape is sufficient to pasture 10 to 15 lambs for two to two and one-half months. It is often sown broadcast, about 5 lbs. to the acre, but will yield much better if drilled about 3 lbs. to the acre in rows 22 inches apart, and cultivated until the plants are well developed. It may be sown in May, but preferably in June or July. Lb., 25 cts.; 100 lbs., \$20.00

Rye, Spring. Sow as a "catch" crop, where Winter grain has failed. The straw is shorter and stiffer than the Winter variety, and is always easily secured, while the grain is of equal value. Sow $1\frac{1}{2}$ to 2 bushels per acre. Bushel (56 lbs.), \$3.00.

Rye, Fall or Winter. Sow in August and September. Prepare the ground as for Wheat and sow at the rate of $1\frac{1}{2}$ bushels per acre. This has no equal as a crop to be used for late Fall and early Spring pasture, and is one of the best to turn under for green manure. Bushel (56 lbs.), \$3.50.

Spring Vetches or Tares. (*Vicia sativa*.) A valuable plant grown extensively for stock and sometimes mixed with Oats for soiling. Culture the same as field Peas. Sow 2 bushels per acre. Peck, \$2.00; bush. (60 lbs.), \$7.25.

It should be sown at the rate of from 3 to 4 pecks, per acre, broadcast or in drills, from August 15 to October 1, and with it as a supporting crop to raise the vines up off the ground there should be planted from 3 to 4 pecks of Winter Wheat, Oats, or Rye. It should be cut while the Vetch is in full bloom. It may be planted in Spring in order to supply an early green crop for soiling purposes, or in midsummer for late Autumn forage. Peck, \$4.50; bush. (60 lbs.), \$16.00

FARQUHAR'S FLOWER SEEDS.

ANNUALS.

The plants in the following list all bloom the first season from seeds. Many plants not annuals botanically, are included because they bloom the first season, and for cultural purposes may be treated as annuals.

THE ANNUAL FLOWERS are equally valuable to professional and amateur gardeners. Few cultivators realize the vast possibilities they afford at a minimum cost and they include a large portion of our most brilliantly colored summer flowers. For cut flowers, garden beds, either in masses of color or for foliage effects, they furnish ample material. A few of them like the Asters, Poppies, Sweet Peas, and Nasturtiums are well known and largely used; there are however, many beautiful species which we enumerate in the following list, which are seldom seen, and which would be appreciated were they once grown.

AMARANTHUS.

Bed of Farquhar's Tuberous-Rooted Begonias.

FARQUHAR'S TUBEROUS-ROOTED BEGONIAS.

The great value of Tuberous-Rooted Begonias for *Lawn beds and borders* is now appreciated. They bloom continuously from early Summer until frost, producing a profusion of large and gorgeous flowers. Throughout Europe they are used very extensively, particularly in the beautiful parks of Paris.

They are of easiest cultivation, rarely attacked by insects or blight, and succeed in any good soil which is kept moderately moist.

The tubers we offer have been specially grown for us by celebrated cultivators, and we feel assured that they are not surpassed by any strain in commerce. Mailed free at dozen rates.

Cultural Directions. The tubers may be started in February or March, either singly or in small pots, or set two inches apart in flat boxes. The soil should be light, containing plenty of leaf mould and sand. In planting, care should be taken to set the crown of the tuber, which is usually somewhat depressed, upwards. The tubers should be covered half an inch with light soil and watered sparingly until they start, after which more water may be given. The temperature should be 60 to 70 degrees. The started plants, when intended for bedding purposes, may be transferred to the beds in the open ground early in June, by which time they should be in bloom. The plants should be set ten or twelve inches apart.

Although there is much to be gained by starting the tubers early as just described they may be planted unstarted in the open ground beds in the last week of May, or later, with excellent results.

They will thrive either in full sunshine or partial shade, but when fully exposed to the sun the beds must be kept moist. A wind-swept situation should be avoided.

They are quite as desirable for bedding purposes, and may be planted out after the middle of June in the sunniest situations if well watered, or in partial shade, but they should be sheltered from strong winds. HARDY LILIES.

Effective results may be obtained by planting groups of hardy Lilies in the herbaceous border or in the front of shrubs, giving them a slight protection which is of great importance to many of them.

It is our opinion that we should plant the bulbs much deeper than we have done heretofore. While travelling in Japan, we found that the bulbs of the wild Lilies were usually twelve to eighteen inches below the surface, and we gathered the finest flowers from specimens growing on mountains of decaying lava where they had abundant rainfall and ample drainage. We believe that varieties like *Aurantum* and *Speciosum* would be favored by being set ten or twelve inches deep and would be less affected by frost and drought. The beds should be thoroughly covered with leaves or litter during the Winter.

Our Autumn Catalogue contains a complete list of hardy Lilies, most of which can be supplied in Spring until May first, if desired. We recommend Fall planting for all the early flowering sorts.

If Lilies are wanted by mail, add 5 cents each.

HARDY PERENNIAL PLANTS.

THE OLD-FASHIONED HARDY FLOWERS. The favorites of old-time gardens are again popular, and deservedly so. No feature of the garden can be more satisfactory than a well-arranged Hardy Plant border, producing from April to November a continuous succession of charming flowers much more interesting than the usual greenhouse assortment, and equally valuable for garden embellishment and cutting purposes. The Hardy Plants have the advantage of greater permanency, requiring only cultivation, enriching a slight mulch during Winter, and an occasional checking of the more robust growers to keep the plantation in good condition for years.

Where early flowers are desired we advocate the introduction of groups of Narcissi, etc., which bloom in April and May and should be planted in October, as well as Montbretias, the hardier species of Gladioli and Lilies for Summer blooming, and which may be planted in Spring.

We limit our list to varieties which have been found generally hardy and most desirable for the severe climate of New England.

Single plants of hardy perennials will be furnished at the following rates: Plants at \$1.50 per dozen, 20 cents each; plants at \$1.75 and \$2.00 per dozen, 25 cents each; plants at \$2.50 per dozen, 30 cents each; plants at \$3.00 per dozen, 35 cents each.

IRISES. (*Fleur de Lis. Iris germanica.*)

Farquhar's *Fleur de Lis* were awarded a silver Medal by the Massachusetts Horticultural Society.

These Irises thrive in a well drained and sunny situation and the finest blooms are obtained from established clumps; consequently when planted they should remain undisturbed for at least five or six years. The plants may be given a light covering of leaves or salt hay (not manure) during Winter. When transplanting, barely cover the rhizomes.

In the descriptions (S) is used to signify standards or the erect petals; (F) falls or the drooping petals.

THE ARISTOCRATS OF THE PÆONIES.

SEVEN MAGNIFICENT NEW VARIETIES.

THE results achieved by years of labor and crossing with the very finest Pæonies then in existence by the late Mr. James Farquhar. In these new varieties there can be traced the finest strains of the French and Richardson types.

These varieties are of the highest quality, large size, strong, erect habit and are all more or less scented. Distinguished by their fine form and coloring. They have been highly commented upon by experts who have seen them, and who claim that they will rank with the very choicest varieties that as yet have been introduced.

We were awarded a Silver Medal by the Massachusetts Horticultural Society for our fine collection. Also first Prize for the finest and largest Pæony in the Show (one of our seedlings).

As our stock of these varieties is limited, orders will be filled strictly in rotation.

Agnes Keogh. Large, double flat compact rose type, of fine clear silvery old-rose pink. \$10.00 each.

Albert, King of the Belgians. Very large, double compact rose type, of brilliant deep pink. \$2.50 each.

Festiva Maxima Rosea. A very large rose type of Festiva Maxima. It is a beautiful shade of clear light pink with center petals tipped carmine. \$10.00 each.

Mrs. William Metcalfe. Very large, full, double rose type, deep rose pink; shaded magenta pink. \$2.50 each.

Massachusetts. Very large, fine full double rose type; deep pink, slightly shading to rose pink. \$10.00 each.

Pæony Festiva Maxima Rosea.

FARQUHAR'S GOLD MEDAL PÆONIES.

The Gold Medal of the Massachusetts Horticultural Society was awarded to R. & J. Farquhar Company for a Display of Pæonies, June 1913.

Pæonies require a good rich, deep soil and an abundant supply of water during the growing season. When enriching the ground the use of too much fresh manure near the roots should be avoided. An important point to observe is not to plant too deep. The roots should be planted so that the eyes will be 2 to 3 inches below the surface. Too deep planting is a frequent cause for shy flowering.

The figure following the name indicates the relative time of flowering.

Walter Faxon. We are now in a position to offer a limited quantity of this handsome variety which is considered by many Pæony experts to be one of the finest of the Richardson seedlings. The large blooms are of globular semi-rose type, color a uniform bright rose deepening towards the centre; fragrant and a free-bloomer. \$5.00 each.

Baroness Schroeder. 2. Very large double globular flowers, blush-pink shading to white. Very vigorous, free bloomer. One of the best. \$2.00 each.

Couronne d'or. 3. Pure white globular flowers with amber-yellow stamens; centre petals tipped carmine. Strong grower, fragrant. \$1.50 each; \$15.00 per doz.

The fruit trees we offer are excellent young stock. Trees when received should be planted at once in rich, prepared soil, the roots being carefully separated and spread. If dry weather follows planting, the trees must be watered and mulched. Branches of last season's growth should be well cut back, thus encouraging the vigorous growth of new shoots.

STRAWBERRY PLANTS.

Cultural Directions. The Strawberry is easily cultivated; abundant crops can be gathered from a variety of soils, differing widely in character, from a light sand to a heavy clay. The best soil is a deep sandy loam, but any soil suited to the growth of ordinary field or garden crops may be trusted to successfully grow the Strawberry. This soil should be broken up and pulverized by spade-trenching or subsoil-plowing, enriching with good stable manure to the depth of fully two feet; the quality of manure to be determined by the condition of the soil. The plants may be set in beds of three rows one foot apart and one foot distant in the rows, with a space of two and one-half feet between the outside rows of adjoining beds left for a pathway. They may also be planted in single rows three feet apart and one foot apart in the rows.

THREE NEW VARIETIES OF STRAWBERRIES.

Raised from seed by the late S. D. Warren of Weston, and claimed by him to be as near rust-proof as possible, with fruit far superior to the older sorts.

Arabine. Extra early, very large, bright red of high quality, very robust grower and heavy cropper.

Roosevelt. A vigorous midseason variety, larger than Marshall, of most excellent quality and color. A superior sort.

Hiawatha. This new late sort ripens a few days ahead of the Commonwealth, which it surpasses in size, color and flavor. It succeeds where others fail.

Layer Plants of the above "Three New Varieties" for delivery April and May. \$4.00 per 100; \$35.00 per 1000

FARQUHAR'S "SELECT" VARIETIES.

FIRST EARLY.

Campbell's Early. One of the earliest berries, unusually productive; fruit large and of a beautiful rich red color.

Excelsior. This is decidedly the best early Strawberry and the earliest good Strawberry. The fruit is of round, conical form, glossy dark-red color, and of mildly acid flavor.

MEDIUM.

Early Jersey Giant. A new, medium-early variety of great merit. The berries are of conical shape with pointed tips and are a bright crimson in color, with a delicious flavor and aroma.

Glen Mary. Large, conical, bright red berries; fine flavor.

Marshall. The fruit of this remarkable sort is of enormous size, of handsome, glossy dark crimson color, and of delicious flavor. It is one of the best midseason berries, either for private use or market. It is a vigorous grower and requires good soil and high cultivation. As it does not thrive in all soils, it should not be planted extensively until its adaptability is ascertained.

Layer Plants of the above "Select Varieties" for delivery April and May. \$3.00 per 100; \$28.00 per 1000

STANDARD VARIETIES

MEDIUM.

Brandywine. A large heart shaped berry, perfect in form, bright red in color, firm flesh, red to the centre and of rich spicy flavor. A great cropper, especially on heavy soils, holds its fruit well up from the ground and generally succeeds everywhere.

Layer Plants of the above "Standard Varieties" for delivery April and May. \$2.50 per 100; \$22.00 per 1000

MEDIUM.—(Continued.)

Abington. A strong native variety of recent introduction. The fruit is of large size, bright red in color, very solid and of excellent flavor.

LATE TO VERY LATE.

Gandy. This popular old variety is probably known by most berry growers. It is more largely grown than any other late variety. On sandy soils it is unproductive.

FALL-BEARING STRAWBERRIES.

The Fall bearing varieties produce fruit at the same season as the ordinary Strawberries, but keep bearing until frost. To get the best results for a late crop, the blossoms must be carefully kept off until July, or the plants will completely exhaust themselves before Fall. If the runners are kept cut during the Summer, it will give additional vigor to the late crop.

Progressive. This variety is considered to be one of the best perpetual bearing Strawberries. The fruit is rich and sweet, a deep red inside and out; of good medium size and quite firm.

Superb. Enormous crops in June, and in September same plants are filled with fruit; it does not fruit on new runners; the berries are large and a rich dark red.

Layer Plants of the above "Fall-bearing Varieties" for delivery April and May. \$4.00 per 100
